AgenticArchitect

Technical Documentation & Architecture

1. Introduction

AgenticArchitect is a local-first multi-agent system designed to transform raw requirements into production-ready AI and Data solutions. It leverages state-graph orchestration to automate the Software Development Life Cycle (SDLC).

2. Technical Stack

The infrastructure, managed via `devbox.json`, ensures high performance and data sovereignty:

- **Orchestration:** K3d / K3s for local Kubernetes clusters.
- **Development:** Skaffold for hot-reloading and UV for Python management.
- **AI Framework:** Pydantic AI for agent logic and Ollama (Qwen 3:0.6B) for local inference.
- **Observability:** Arize Phoenix for tracing agentic workflows.

3. Agentic Workflow

The system operates through four specialized roles:

1. **Project Manager Agent:** Validates SMART criteria and identifies gaps.
2. **Data Analyst Agent:** Handles EDA (Exploratory Data Analysis) and synthetic data generation.
3. **Architect Agent:** Designs C4 Diagrams and Architecture Decision Records (ADR).
4. **Engineer Agent:** Implements SOLID-compliant code using TDD principles.

4. Quick Start

To initialize the development environment:

```
# Install tools and deploy the cluster  
make install && make cluster && make setup-dev
```

```
# Start the pipeline with hot-reload  
skaffold dev
```

Key Service Endpoints:

Architect App : <http://localhost:8080>

Phoenix UI : <http://localhost:6006>

Ollama API : <http://localhost:11434>
